ETH Zürich

Doctoral Thesis

Same-sign dileptons as a search tool at CMS

Author:

Marc Dünser

Supervisor:

Prof. Dr. Rainer Wallny

A thesis submitted in fulfilment of the requirements
for the degree of Doctor of Science

in the

Institute for Particle Physics
D-PHYS

October 2014

Declaration of Authorship

I, Marc Dünser, declare that this thesis titled, 'Same-sign dileptons as a search tool at CMS' and the work presented in it are my own. I confirm that:

- This work was done wholly or mainly while in candidature for a research degree at this University.

- Where any part of this thesis has previously been submitted for a degree or any other qualification at this University or any other institution, this has been clearly stated.

- Where I have consulted the published work of others, this is always clearly attributed.

- Where I have quoted from the work of others, the source is always given. With the exception of such quotations, this thesis is entirely my own work.

- I have acknowledged all main sources of help.

- Where the thesis is based on work done by myself jointly with others, I have made clear exactly what was done by others and what I have contributed myself.

Chapter 1

Introduction

The construction of the LHC and its experiments over the few last decades has been only the last step in a long and successful history of particle accelerators that started roughly 100 years ago. Just as the first specimens of its kind, the LHC serves – first and foremost – the purpose of fundamental research.

Chapter 2 describes the fundamentals of particle physics from a theoretical standpoint, Chapter XXXX

Chapter 2

Theory

In order to interpret any experimental result, it is of paramount importance to understand the underlying model governing the physical processes in question. Modern physics knows a large number of rather successful theories all dedicated to describing different mass and energy scales. An example is the theory of classical mechanics, which manages to describe the physics of 'daily life' very well. However, it breaks down when velocities approach the speed of light and has to be incorporated into a broader theory, namely that of relativity.

This specific example already suggests that different physical theories are valid only in a certain energy range and describe only a certain 'type'[1] of physical process. This fact is also true for the case of particle physics. The relevant theory is called the *'Standard Model'* and will be described hereafter. Further into the chapter, a short description of the pitfalls of the standard model will be given with some explanation on possible solutions.

2.1 The Standard Model

The Standard Model (SM) of particle physics provides the theoretical framework that describes all fundamental particles and the forces that act between them, with the one exception of gravity. Despite a few drawbacks that will be described later (see Section XXX) it has been an overwhelmingly successful theory, capable of describing experimental data with a precision that is simply outstanding.

---

[1]In this particular example electromagnetic interactions are – for instance – not described at all.

Appendix A

Dummy Appendix

You can defer lengthy calculations that would otherwise only interrupt the flow of your thesis to an appendix.
